

We claim:

- 1 1. A semiconductor resonator structure comprising:  
2 a light transmissive substrate;  
3 a guiding channel defined in the substrate; and  
4 at least two distributed gratings defined in the substrate surrounding the  
5 guiding channel by at least two opposing sides of the guiding channel, wherein  
6 either the period of each of the gratings or their refractive index or both are not  
7 constant.
- 1 2. The structure of claim 1 wherein the channel has an external side and an  
2 internal side and where the gratings disposed on the external and internal sides  
3 are different.
- 1 3. The structure of claim 1 wherein the gratings have an index profile given  
2 by  $n(\rho) = n_{eq}(\rho) R / \rho$  and  $n_{eq}(\rho = R \exp(U/R))$  has a conventional Bragg grating  
3 index profile, where  $\rho$  is the radial polar coordinate,  $n(\rho)$  is the real index of  
4 refraction as a function of  $\rho$ ,  $n_{eq}(\rho)$  is the equivalent index of refraction as a  
5 function of  $\rho$ ,  $U$  is a transformational coordinate given by  $\rho = R \exp(U/R)$ , and  $R$   
6 is an arbitrary constant.

- 1 4. The structure of claim 1 wherein the gratings are Bragg gratings  
2 comprised of layers with a width,  $w = u_2 - u_1$ , determined according to

3 
$$\frac{\pi}{2} = \int_{u_1}^{u_2} \sqrt{k_0^2 n_{eq}(u)^2 - m^2 / R^2} \cdot du$$

- 4 where  $\rho$  is the radial polar coordinate shown as the integration variable  $u$  above,  
5  $k_0$  is the wave number in vacuum of the light propagating in the structure,  $n_{eq}(\rho)$   
6 is the equivalent index of refraction as a function of  $\rho$ ,  $m$  is a predetermined  
7 azimuthal number,  $R$  is the radius of the internal edge of the grating,  $u_1$  and  $u_2$   
8 are respectively the initial and end radii of a Bragg layer in the grating.

- 1 5. The structure of claim 1 wherein the shape of the resonator is circular.

- 1 6. The structure of claim 1 wherein the shape of the resonator is oval.

- 1 7. The structure of claim 1 wherein the index of refraction of the guiding core  
2 is smaller than the index of refraction of the surrounding distributed gratings.

1 8. The structure of claim 2 wherein the index of refraction of the guiding core  
2 is smaller than the index of refraction of the surrounding distributed gratings.

1 9. The structure of claim 1 wherein the distributed gratings are made of  
2 dielectric material.

1 10. The structure of claim 1 wherein at least part of the substrate is "active"  
2 and able to provide optical gain.

1 11. The structure of claim 1 wherein the distributed gratings are comprised of  
2 alternating index layers.

1 12. An optical resonator with large free spectral range (FSR) and low losses  
2 comprising:

3 an optical substrate;

4 a guiding channel defined in the substrate; and

5 at least one radial Bragg reflector adjacent to the guiding channel to  
6 confine light therein.

1 13. The optical resonator of claim 12 where the guiding channel and adjacent  
2 radial Bragg reflector form a combination with radial structure, is a combination  
3 characterized by a profile of the refractive index, which profile is a periodic  
4 function superimposed on a decreasing function of radial position.

1 14. The optical resonator of claim 13 where the Bragg reflector is comprised  
2 of a plurality of radial layers having a distinct refractive index from the refractive  
3 index of the substrate, where the plurality of radial layers have an internal edge,  
4 and where the width of each layer is selected so that constructive interference of  
5 all partial reflections from the plurality of layers is obtained at the internal edge of  
6 the Bragg reflector.

1 15. The optical resonator of claim 14 where the optical resonator has a  
2 resonant frequency of light, where each layer of the Bragg reflector has a  
3 thickness and where the thickness of each layer is greater than the constant  
4 Bragg thickness for reflector at the resonant frequency of light and decreases  
5 asymptotically toward the constant Bragg thickness as the distance of the layer  
6 away from the guiding channel increases.

1 16. The structure of claim 15 wherein the thickness of each layers is  $w = u_2 -$   
2  $u_1$ , determined according to

$$\frac{\pi}{2} = \int_{u_1}^{u_2} \sqrt{k_0^2 n_{eq}(u)^2 - m^2 / R^2} \cdot du$$

3

4 where  $\rho$  is the radial polar coordinate shown as the integration variable  $u$  above,  
 5  $k_0$  is the wave number in vacuum of the light propagating in the structure,  $n_{eq}(\rho)$   
 6 is the equivalent index of refraction as a function of  $\rho$ ,  $m$  is a predetermined  
 7 azimuthal number,  $R$  is the radius of the internal edge of the grating,  $u_1$  and  $u_2$   
 8 are respectively the initial and end radii of a Bragg layer in the grating.

1 17. The optical resonator of claim 12 where the guiding channel is  
 2 characterized by a low index of refraction.

1 18. The optical resonator of claim 12 where the guiding channel forms a  
 2 closed loop.

1 19. The optical resonator of claim 12 where the guiding channel has an  
 2 external side and an internal side, and where the at least one radial Bragg  
 3 reflector is comprised of at least two radial Bragg reflectors, a first one of the two  
 4 radial Bragg reflectors is disposed on the external side of the guiding channel

5 and adjacent thereto and a second one of the two radial Bragg reflectors is  
6 disposed on the internal side of the guiding channel and adjacent thereto.

1 20. The optical resonator of claim 12 further comprising means for pumping  
2 the guiding channel.
